Team Agreement

Project goal: To learn the foundational concepts of big data mining and apply them throughout this project using the skills and tools learned in CS 483

Project deliverables: The deliverables for this project are the project proposal, presentation, and large dataset. All of these will be stored in the GitHub repo so that all group members have access to them.

Communication and meeting: We will meet with each other at least once a week in the library at 12:30. If a problem arises or someone has a question, we will communicate it in the group chat that we have and after every meeting we will update the product and spring backlog.

Distribution of work: We will delegate tasks equally among all the members of our group, however, if a group member is unable to finish their portion of the project, it is their responsibility to notify the other group members and let them know so they can delegate the task to someone else.

Tools used: In this project, we will practice using PySpark in order to understand the full cycle of how to work with big data and distributed systems. For our dataset, we will be using Kaggle, and for collaboration, we will use GitHub.

Expectations: All group members are expected to attend meetings and complete the tasks assigned to them. If any problems arise, they must be communicated either in person to the entire group or in the group chat by text.
